

CASE STUDY

Waterproof and seal run off basins

Weilman Plastics of Pearlinton MS has a 30' deep by 20' across by 40' long run off basin that had to be waterproofed, and the coating had to be impervious to the many chemicals which could be in the basin.

In October 1998, Pro Set pressure washed the walls and floor of the basin, then filled in the many pours (bug holes) of the concrete with an elastomer acrylic latex. We then applied 50 - 55 mls of Poly Pro to waterproof and make the entire area impervious to glycols, monomers, and many other related chemicals.

The system sealed off the basin and the customer is extremely happy with the project.
